

Escar-Go!™ Slug & Snail Control

Nature's secret slug control for home gardeners

Escar-Go!® Slug & Snail Control. Escar-Go! is a unique blend of iron phosphate (it occurs naturally in soil) and is a bait that lures slugs and snails away from their hiding places.

Escar-Go! protects lettuce, tomatoes, chard, cabbage, squash and corn and other vegetables from slug and snail damage. It may also be used in the home orchard, in the berry patch, around hostas and other ornamentals and on lawns. In home greenhouses, may be applied to the soil in plant pots or around greenhouse benches. Escar-Go!:

- **Has a powerful lure that slugs and snails find irresistible!** Repeated studies have shown that slugs and snails will eat Escar-Go! before they will eat nearby plants.
- **Contains a potent natural control.** As soon as these slimy mollusks ingest even a small amount of Escar-Go!, they stop feeding and begin to die within 3 to 6 days.
- **Disposes of snails and slugs without mess.** You may not see the dead slugs and snails in your garden because they often crawl away to secluded places to die. But you will notice that your plants are no longer being eaten.
- **Controls in hard-to-reach areas.** Because Escar-Go! actually lures snails and slugs from their hiding places, it provides control in any area that slugs frequent - even in mulched beds.
- **Controls better than other standard remedies.** Test after test, here and in Europe, has proven that Escar-Go! controls slugs as well as, or better than diatomaceous earth (D.E.) and other slug and snail remedies, including the standard chemical controls.

Can be Used Around Pets and Wildlife

Scatter Escar-Go! granules on the soil around or near the plants to be protected. Apply particularly in damp places around beans, tomatoes, lettuce, cabbage, celery and squash and other areas favored by snails and slugs where they obtain shelter by day.

Evening is the best time to apply Escar-Go! because slugs and snails travel and feed mostly at night or in the early morning. If the soil is dry, wet it before applying. Apply evenly at about 1 lb. per 1,000 sq. ft. (That's about 1 level teaspoonful per square yard.) Reapply when you see that the bait has been consumed, or at least every two weeks. Apply more heavily if the infestation is severe, if the area is heavily watered or after long periods of heavy rain. Any Escar-Go! that isn't eaten will degrade and become part of your garden soil. Naturally, you don't have to worry about secondary poisoning of pets or wildlife.

Slugs Work Under Cover

Slugs and snails normally feed at night, and young garden seedlings and transplants are among their favorite meals. Healthy, promising seedlings can vanish overnight, and by the time you figure out what happened, the culprits are gone. (Only 5% of the slug population is aboveground at any one time. The other 95% is underground, digesting your seedlings, laying eggs and feeding on roots and seed sprouts.) As a result, slugs get away with "plant murder"...and cutworms often get the blame.
